1. Uses and specifications of machines.

1. The main structure, characteristics and uses of machines.

GK35 series bag closing machines fall into three styles, man operated start and stop of the machine with semi-automatic thread chain cutter, automatic start and stop of the machine with solenoid operated thread chain cutter, and with electro-pneumatically operated thread chain cutter.

All these machines adopt semi-closed structure for easy maintenance.

Crankshaft tail end adopt closed rolling bearing mechanism for the purpose of high-speed wear resistance and flexible.

Lubrication system falls into cup permeating oil felt reservoir and spray type.

Main parts adopt wear resistance materials such as alloy steel and alloy copper etc.

All types of thread chain cutter adopt safe build-in structure.

All types of machine head hang on column support combined with feeding device for closing filled bags and sacks made of cotton, jute, plastic and paper etc.

2. Styles, names, performances and specifications.

Model GK35-8 bag closing machine.

Equipped with mechanical thread chain cutter which make reciprocating motion by running of the machine. The bag being fed into the machine will continue to sew a length of thread chain after closing the bag. Push the thread chain together with materials into open slot in the throat plate to cut. Start and stop of the machine are operated by hand.

Main specifications

No.	Items	Styles		
		GK35-8C	GK35-8D	GK35-8E
1	Max. sewing speed	1900rpm		
2	Max. sewing thickness	8mm		
3	Stitch range	6, 5-11mm		
4	Seam specification	two thread double lockstitch 401		
5	Thread type	21s/5, 20s/3 polyester thread		
6	Presser foot lifting height	15mm	11-15mm	15mm
7	Needle No.	type 80800 200-250#		
8	Working dia. of pulley	114mm		
9	Thread chain cutter	Man-operated mechanical type	Electro-solenoid operated type	Electro-pneumatically operated type
10	Motor	ordinary	brake	brake
11	Motor power	370w		
12	Weight	27kg	30kg	30kg
13	Size(L × W × H)	350 × 215 × 440mm	350 × 240 × 440mm	350 × 240 × 440mm

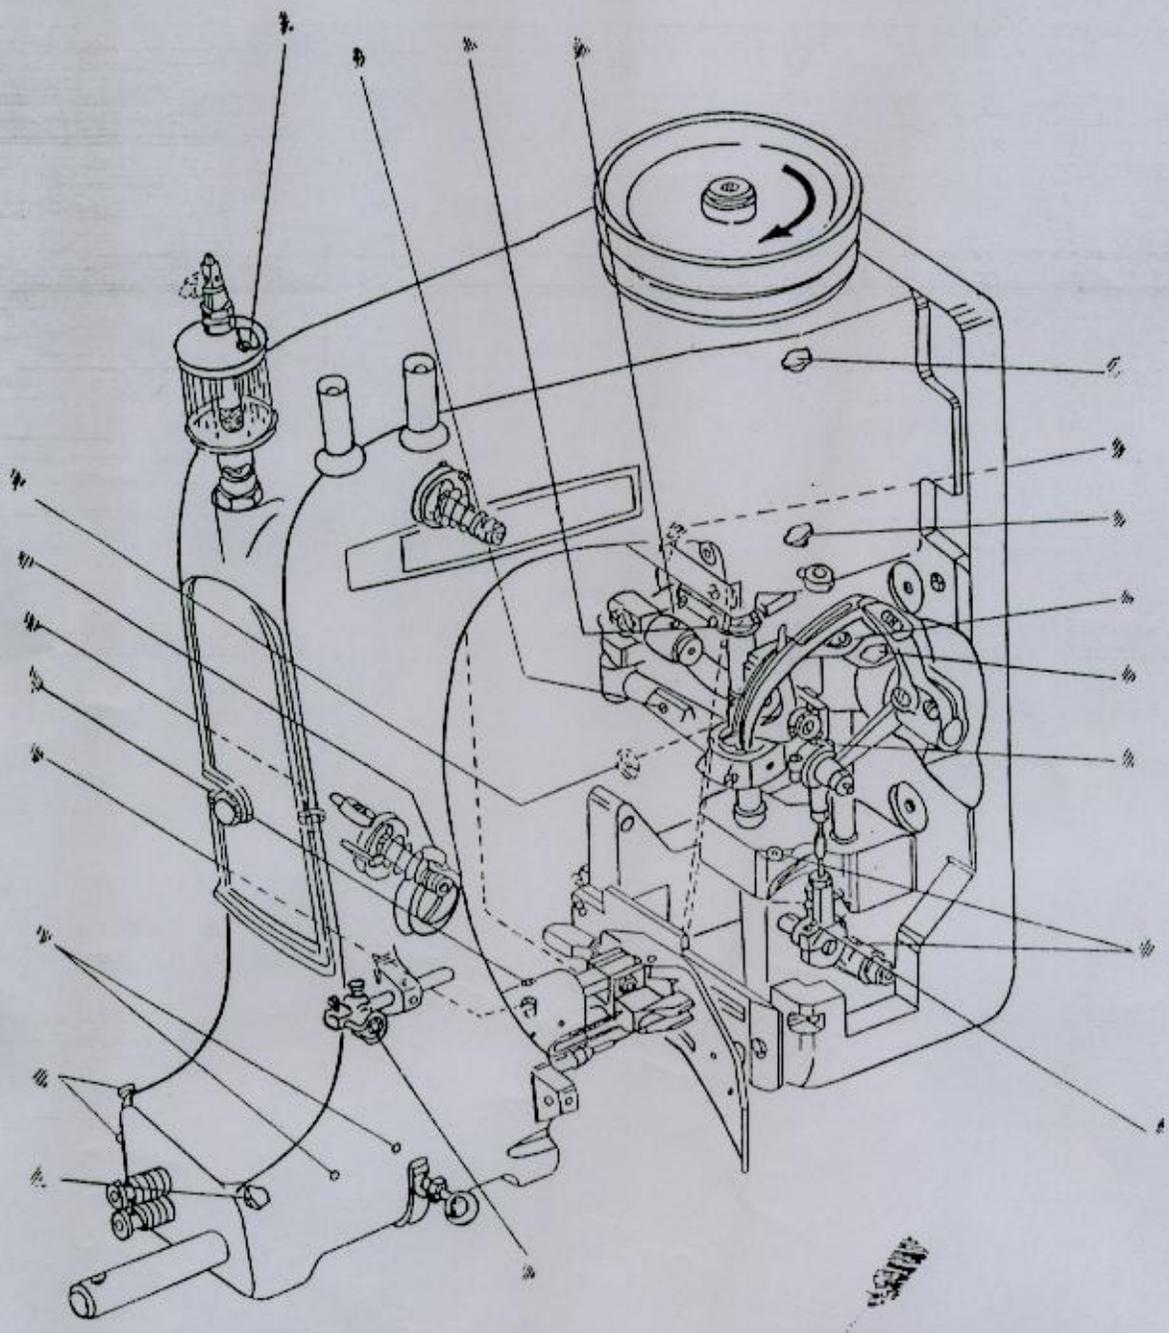

Fig. 1. 1420

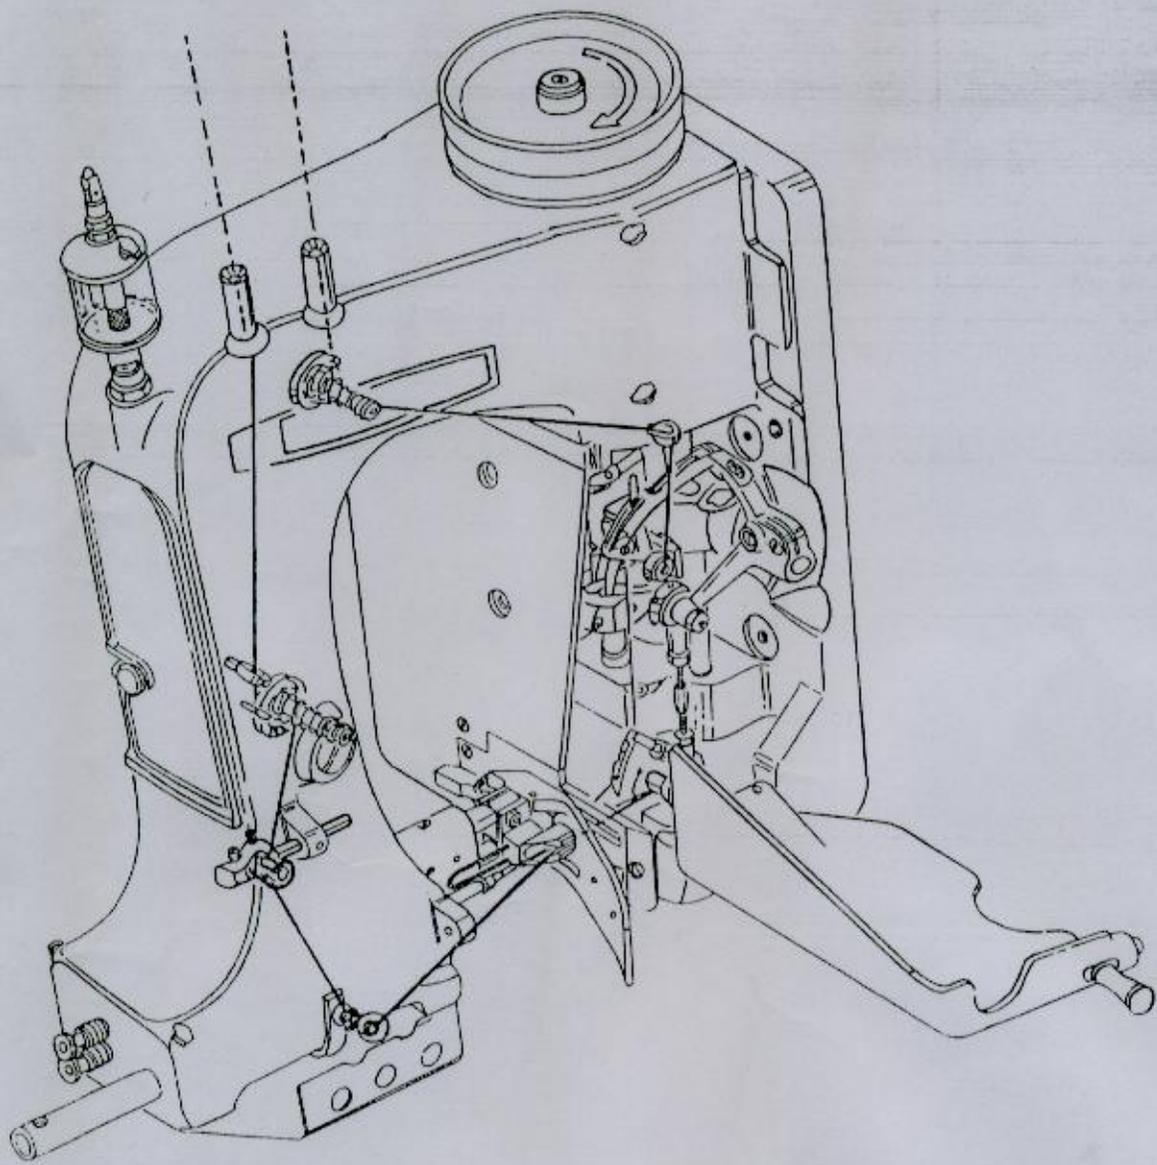

Fig. 2

II How to use and adjust the machine

1. Caution before use.

New machines or through long time storage machine must be checked before operating. Cleaning the anti-rust grease and dust on the surface of the machine, and filling oil cup and oil roles with sewing machine oil or 20# oil. Turning the pulley clockwise by hand, checking for free and coordination, checking motor rotating direction for the same as that of the machine running, then starting the machine for test sewing.

For automatic style machine, check electrical equipment, circuit and pneumatic cell for good. Before threading, filling oil, adjusting or replacing parts, all power source must be cut off to prevent personal injury.

2. Lubrication

Routine maintenance is important to maintain long time use. Machines have to be cleaned and lubricated twice a day on the lubricating points on the oiling diagram (Fig. 1); and oil test has to be soaked in oil. The sight feed oiler or oil sprayer has to be kept filled and should be adjusted so that it feeds two or three drops of oil per stroke.

3. Selection of the needle and thread, threading.

Selection of the needle and thread depends on quality and technical demand of sewing material. Good combination of the needle and thread is one of the basic condition to get perfect sewing performance. The needle point must be sharp, and thread must be strong enough.

Thread machine as illustrated in Fig. 2, draw out upper and lower thread from needle eye and looper hole about 50mm (2in.).

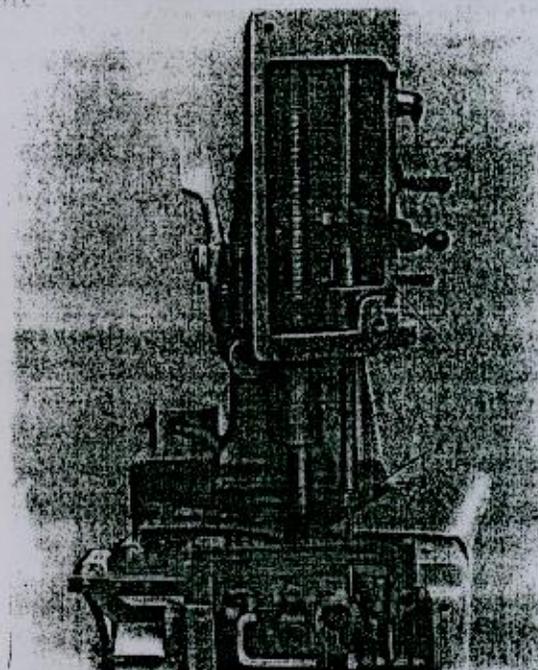

Fig. 3

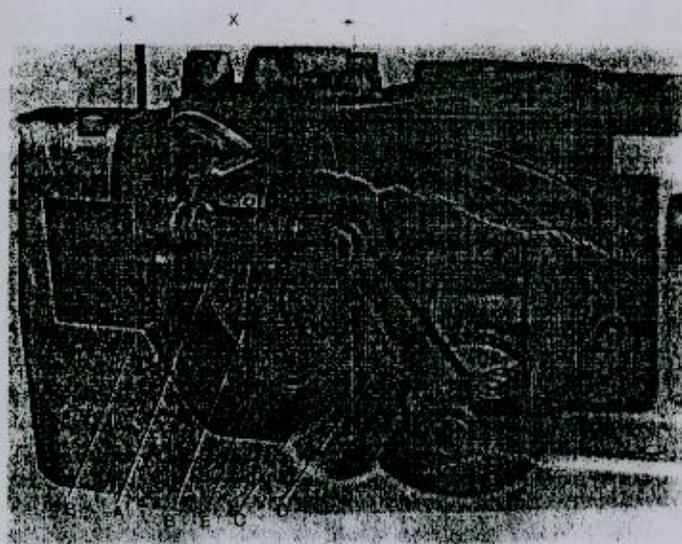

Fig. 4

4. Inserting the needle.

The needle is vulnerable part. When the needle eye wear out obviously, needle point wear dull or bend, replace the needle. When replacing the needle, turn the pulley until the bar reaches its highest point. Loosen the needle set screw (A, Fig. 3), and insert a new needle with the shank as far as possible into the needle bar. The needle groove must point to the sewing material direction. Then retighten the needle set screw.

5. Setting the looper.

Setting the looper as follows:

(1). First set the looper connecting rod (A, Fig. 4), so the distance (X, Fig. 4) between the center lines of the two ball joints is 69.8mm (2 3/4in.). For adjustment loosen the two nuts (B) and turn connecting rod (A) forward or backward as required to obtain specified dimension. Retighten nuts (B). Caution: The left nut has a left hand thread.

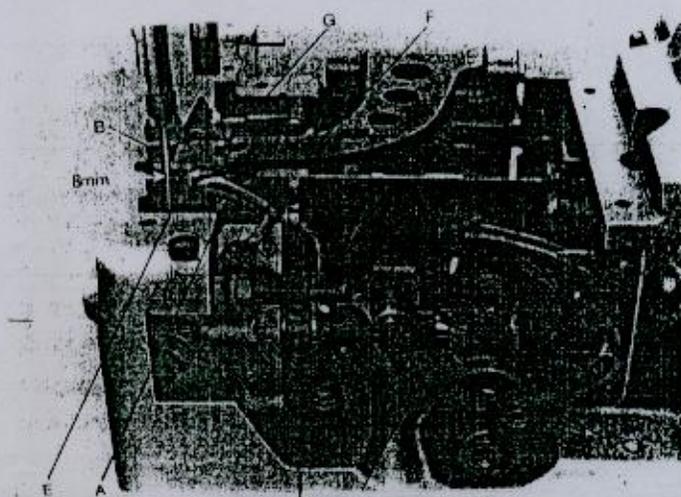

Fig. 5

(2). Rotate the machine pulley clockwise by hand, so that the needle bar moves to the lowest point, at the same time the looper moves back to its farthest position to the right. The distance from the point of the looper (A, Fig. 5) to the centerline of the needle is 8mm (5/16in.). For adjustment, loosen two screws (C) in the looper drive lever, rotate looper drive lever (D) left or right as required to obtain specified dimension and retighten screws (C).

Caution: Pull looper drive lever rocker shaft back tightly when tighten screws (C), so that the end face of the looper drive lever rocker lean against that of shaft bushing, assuring that all end play is taken out. (Otherwise it will make noises).

(3). Rotate the machine pulley so that the looper moves from right to left. The looper point should pass as close as possible to the back of the needle without contacting, and clearance is 0.08-0.13mm (.003 to .005 in.) (Fig. 6). For adjustment, loosen screw (D, Fig. 4) in the looper eccentric fork (E) and turn rocker shaft (E) on the looper rocker with looper forward or backward as required. Retighten screw (D).

6. Setting the height of the needle bar.

Remove the needle plate. Rotate the machine pulley in operating direction until the looper moving to the left. When the looper point projects 1-1.5mm (.040 to .060 in.) left of the needle, lower edge of looper and upper edge of needle eye must be flush in this position. (Fig. 7) For adjustment, loosen clamp screw (B, Fig. 3) in the needle bar up or down as required. Retighten screw (B) and remount needle plate.

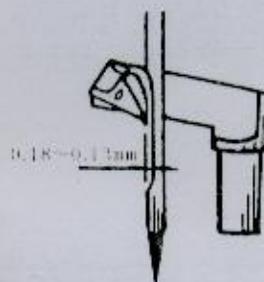

Fig. 6

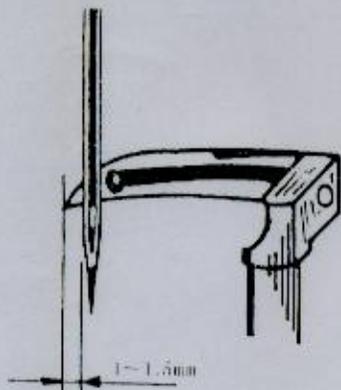

Fig. 7

7. Setting the needle guard.

The needle will bend or break when abutting bags made of different thickness of sewing material. And the needle guard (E, Fig. 5) will protect the needle. The clearance between the needle and the needle guard is 0.08-0.13mm (.003 to .005 in.) (Fig. 8). For adjustment, rotating pulley in the direction of operating, so that the needle guard moves against the needle. Loosen set screw (G) on feed dog holder (Fig. 5), move the needle guard accordingly. Retighten screw (G).

8. Setting the feed dog.

The height of the feed dog (A Fig. 8) are determined by the quality and thickness of the sewing materials. For closing thin material such as bags made of cloth and plastic, teeth should project 1.5mm (.070 in.)

above the throat plate(D) top surface, and for sacks about 2.2mm(0.90") above the throat plate. For setting, move the feed dog to the highest position, remove throat plate and feed dog, adjust the supporting screw (C) as required, remount the feed dog and throat plate. Retighten screws (B).

If feed dog are not in the center in the throat plate slots, loosen screws rear in the feed locker (C, Fig.9), move the feed locker right or left as required. Then retighten screws (D).

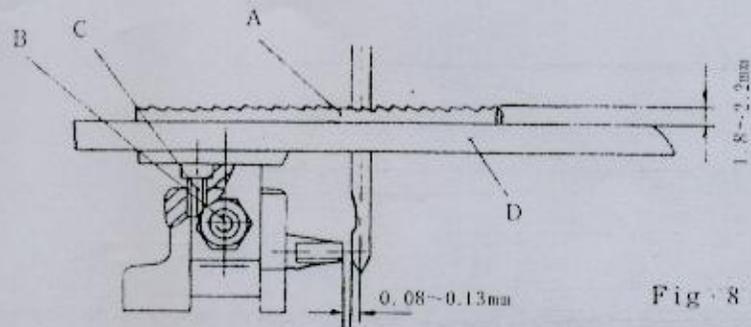

Fig. 8

9. Changing stitch length.

The length of the stitch can be adjusted by raising or lowering the stud (A) in the segment slot of the feed locker (C, Fig. 8). Lowering the stud will shorten the stitch. After loosening nut (B), stud (A) can be moved accordingly. When the desired stitch length is obtained, retighten nut (B). (For automatic style machines the cloth plate should be removed to adjust)

Caution: Any change in stitch length will necessitate a corresponding change in the needle guard and needle clearance.

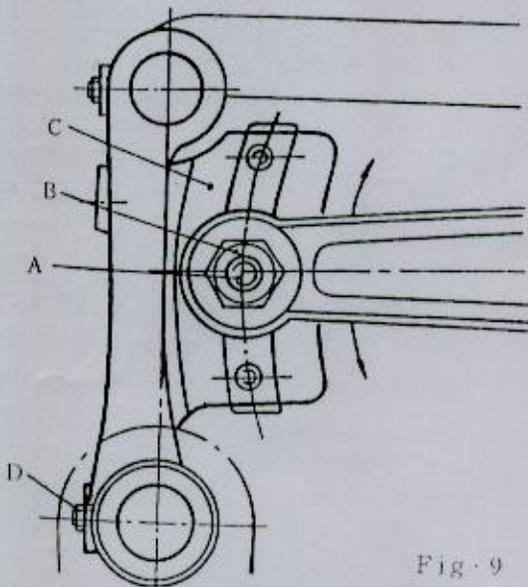

Fig. 9

10. Setting presser foot pressure.

Presser foot pressure are determined by the thickness of the sewing material. When sewing thick materials, decrease pressure; when sewing thin materials, increase pressure. When feed sewing materials smoothly and stitches are uniform, don't increase pressure, to reduce parts wear. For setting pressure, turn two collar in to increase pressure, turn out to decrease pressure.

The presser foot pressure of styles GK35-SE and GK35-0D can be adjusted by adjusting screw (A, Fig. 10) on the upper cover plate. When adjusting, loosen lock nut (C, Fig. 10), turn adjusting screw (A) to increase pressure, and turn out to decrease pressure. Retighten lock nut (C) after adjusting.

11. Setting thread tension.

Thread tension is adjusted by thread tension assembly (B, C, Fig. 10). Tension of upper thread(B) is generally stronger than that of lower thread(C). Turn thread tensioner nut(B, C) in to increase the tension, turn it out to decrease the tension. If the stitch is still not good, should adjust the height of thread adjusting bar(D). The height of the thread adjusting bar(D) is at the same level with the thread eye of the needle bar connection in its highest position.

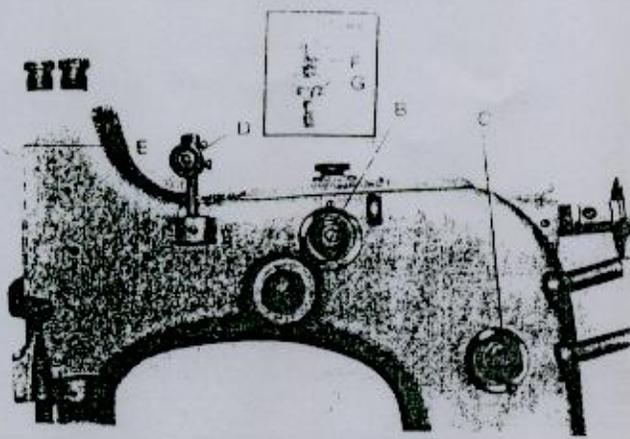

Fig. 10

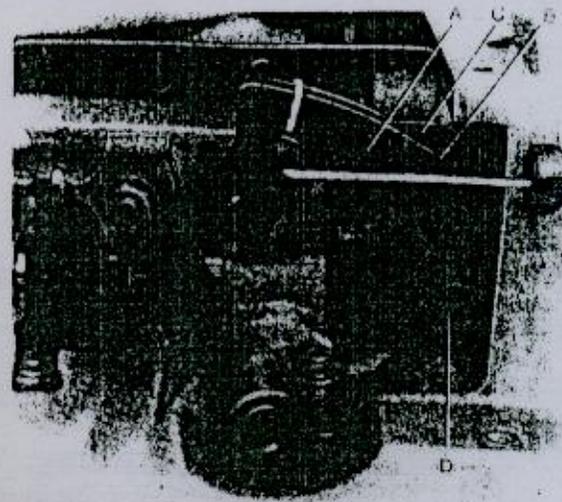

Fig. 11

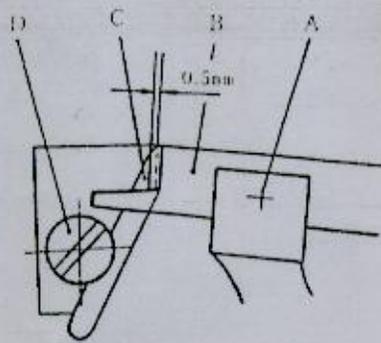

Fig. 12

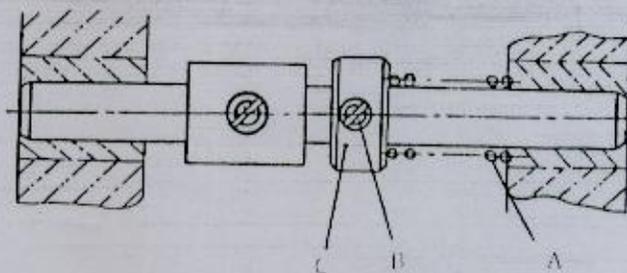

Fig. 13

12. Setting looper thread take-up mechanism.

Looper thread take-up mechanism consists of looper

thread take-up (C, Fig.) and cast-off hook (A). When the needle falls down into the loop formed by looper, the point of the descending needle is flush with the lower edge of looper or projects up to 1mm (.40 in.) below the lower edge of the looper. At the same time lower thread is released in R angle (B) from the cast-off hook (A) of the looper. For adjustment, loosen screw (D), raise the looper thread take-up (A) to delay releasing of the lower thread; lower the looper thread take-up to move up the releasing of the lower thread. Retighten screw (D). It is very important for stitch forming to adjust thread take-up correctly.

13. Setting the mechanical thread chain cutter.

Model GK35-8 thread chain cutter are driven by mechanism. The knife (C, Fig. 12) is positioned in the tapered slot in the front of base by screw (D). The cutting steel (B) is positioned in the slot of the knife holder by screw (A) and making reciprocating motion by running of the machine. In cutting, the edge of the cutting steel and the knife should overlap by 0.5mm (.020 in.). For adjustment, loosen screw (A) and (D), set as required, retighten screw.

Caution: The tip of the knife and the cutting steel should be positioned 0.3-0.5mm (.012 to .020 in.) below the throat plate top surface.

The lateral pressure between the knife and the cutting steel is activated by the spring (A, Fig. 13). And it is determined by actual requirement in thread chain cutting. For adjustment, loosen the collar (C) of spring and screw (B), increase or decrease the pressure as required, then retighten screw (B).

III. Trouble shooting

Symptom	Probable Cause	Remedy
Thread Breaking	<ol style="list-style-type: none"> 1.Improper threading 2.Thread jamming 3.Thread tension are too tight 4.Uneven thread, not strong enough 5.There are burrs on needle eye, throat plate hole and looper 6.Motion of needle and looper are not consistent 7.Needle strike needle guard or looper 8.Feed dog teeth are too sharp 9.Excessive presser foot pressure 10.Position of looper thread take-up piece is too high, releasing of lower thread is too slow 	<ol style="list-style-type: none"> 1.Rethread following instruction (Fig.2) 2.Check and resolve 3.Release thread tension 4.Select good quality thread 5.Grind or replace 6.Adjust as required 7.Adjust as required 8.Wear teeth dull 9.Decrease pressure 10.Lower looper thread take-up piece, quicken lower thread releasing
Skipping	<ol style="list-style-type: none"> 1.Improper setting of needle 2.Motion of needle and looper are not consistent 3.Position of needle is too high, looper 4.Position of looper thread take-up piece is too lower, releasing of lower thread is too fast 5.Thin needle, rough thread 	<ol style="list-style-type: none"> 1.Adjust needle 2.Adjust as required 3.Adjust the height of needle or replace 4.Raise the position of thread take-up piece, delay lower thread releases 5.Replace needle or thread
Needle Breaking	<ol style="list-style-type: none"> 1.Needle bent 2.Needle strike looper or needle guard hard 3.Bad feeding speed is faster than sewing speed 4.Thin needle closing thick sewing materials 	<ol style="list-style-type: none"> 1.Replace needle 2.Adjust the play 3.Adjust feeding speed or sewing speed 4.Replace needle
Needle Thread Tension Uneven	<ol style="list-style-type: none"> 1.Insufficient needle thread or excessive needle thread 2.Improper needle thread tension pressure 	<ol style="list-style-type: none"> 1.Adjust the height of thread adjusting bar 2.Adjust needle thread tension
Looper Thread Tension Uneven	<ol style="list-style-type: none"> 1.Insufficient looper thread or excessive looper thread 2.Improper looper thread tension pressure 	<ol style="list-style-type: none"> 1.Adjust position of looper thread take-up piece 2.Adjust thread tension pressure
Feeding Material Stagnant	<ol style="list-style-type: none"> 1.The surface of feed dog is too low or the surface wear out 2.Presser foot pressure is too small 3.Set screw of feeding cam loosen 	<ol style="list-style-type: none"> 1.Raise the surface of feed dog or replace 2.Increase pressure 3.Tighten screw
Upper And Lower Material Are Not In A Lever	<ol style="list-style-type: none"> 1.Presser foot pressure is too small 2.Presser foot surface are not smooth, friction is too big 	<ol style="list-style-type: none"> 1.Adjust to increase pressure 2.Polish presser foot
The Machine Run Hard	<ol style="list-style-type: none"> 1.The machine assemble bad 2.Driving pulley is too tight 3.Moving parts lack of oil 	<ol style="list-style-type: none"> 1.Check assembling clearance step by step, and adjust 2.Release pulley properly 3.Cleaning and oiling
Large Noises	<ol style="list-style-type: none"> 1.Driving parts are vulnerable, leading to clearance increasing 2.Set screw loosen, leading to parts striking each other 3.Oil connection are not smooth, friction is too big 	<ol style="list-style-type: none"> 1.Replace parts 2.Tighten screws 3.Cleaning and oiling
